

New Release

Alicona Imaging, 3D specialist in optical measurement and inspection, has launched the release of InfiniteFocus 2.0. InfiniteFocus is an optical 3D surface measurement device which yields robust and dense results even at steep flanks, strong roughness and highly differentially surface reflection properties. Measurements are performed with 20 nm vertical resolution. InfiniteFocus 2.0 includes various novelties. A highly increased vertical scan

range enables even more accurate and robust 3D measurements. The maximal scan range is only limited by the working distance of the objectives. Double scan speed is feasible. A new integrated automation module automates working sequences. Calibration, adjustment and verification are revised.
